

Assignment-15

Lab 15 – Backend API Development: Creating RESTful Services with AI

NAME: M.Nithisha

Htno : 2503A51458

BATCH:16

Task 1 – Student Records API Task:

Use AI to build a RESTful API for managing student records.

Instructions:

- Endpoints required:
 - o GET /students → List all students
 - o POST /students → Add a new student
 - o PUT /students/{id} → Update student details
 - o DELETE /students/{id} → Delete a student record
- Use an in-memory data structure (list or dictionary) to store records.
- Ensure API responses are in JSON format. **Code :**

The screenshot displays a VS Code editor with a Python FastAPI application named 'lab15_student_api.py'. The code defines a FastAPI app, a 'Student' data model, an in-memory database 'students_db', and two endpoints: a GET endpoint for listing all students and a POST endpoint for creating a new student. The terminal window shows the application running on port 8000, with several successful HTTP requests (200 OK) for the GET /students endpoint and one 404 Not Found response for a non-existent student ID.

```
lab15_student_api.py X
lab15_student_api.py
1 # lab15_student_api.py
2 from fastapi import FastAPI, HTTPException
3 from pydantic import BaseModel
4 from typing import List
5
6 # Initialize the FastAPI app
7 app = FastAPI(
8     title="Student Records API",
9     description="A simple RESTful API for managing student records.",
10    version="1.0.0"
11)
12
13 # ----- Data Models -----
14 class Student(BaseModel):
15     id: int
16     name: str
17     age: int
18     major: str
19
20 # In-memory database (dictionary)
21 students_db = {}
22
23 # ----- API Endpoints -----
24
25 @app.get("/students", response_model=List[Student])
26 def get_students():
27     """
28     Get a list of all students.
29     """
30     return list(students_db.values())
31
32
33 @app.post("/students", response_model=Student)
34 def create_student(student: Student):
35     """
36     Add a new student to the database.
37     """
```

Terminal Output:

```
PS D:\BTECH\AI Assisted Coding\LABS ASSIGNMENTS\Lab 15> uvicorn lab15_stud
ent_api:app --reload
>>

Swagger UI: <http://127.0.0.1:8000/docs>

Commands :

`pip install fastapiuvicorn`

`uvicorn lab15_student_api:app --reload` **Output:**

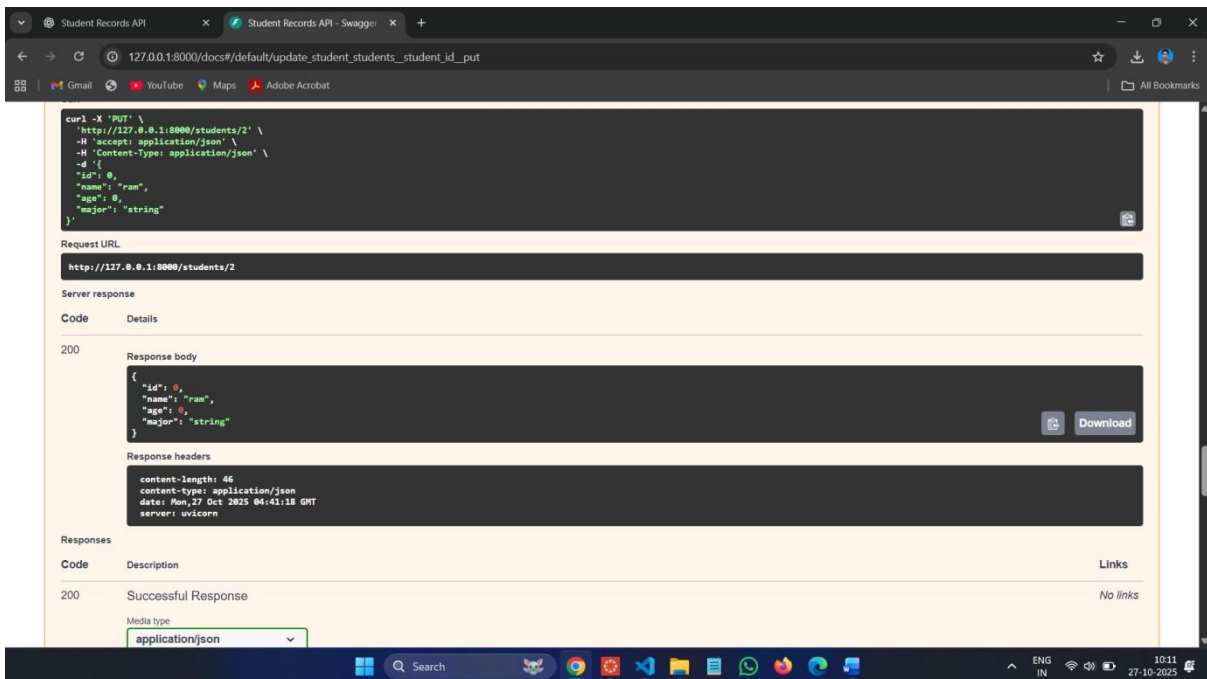

POST :

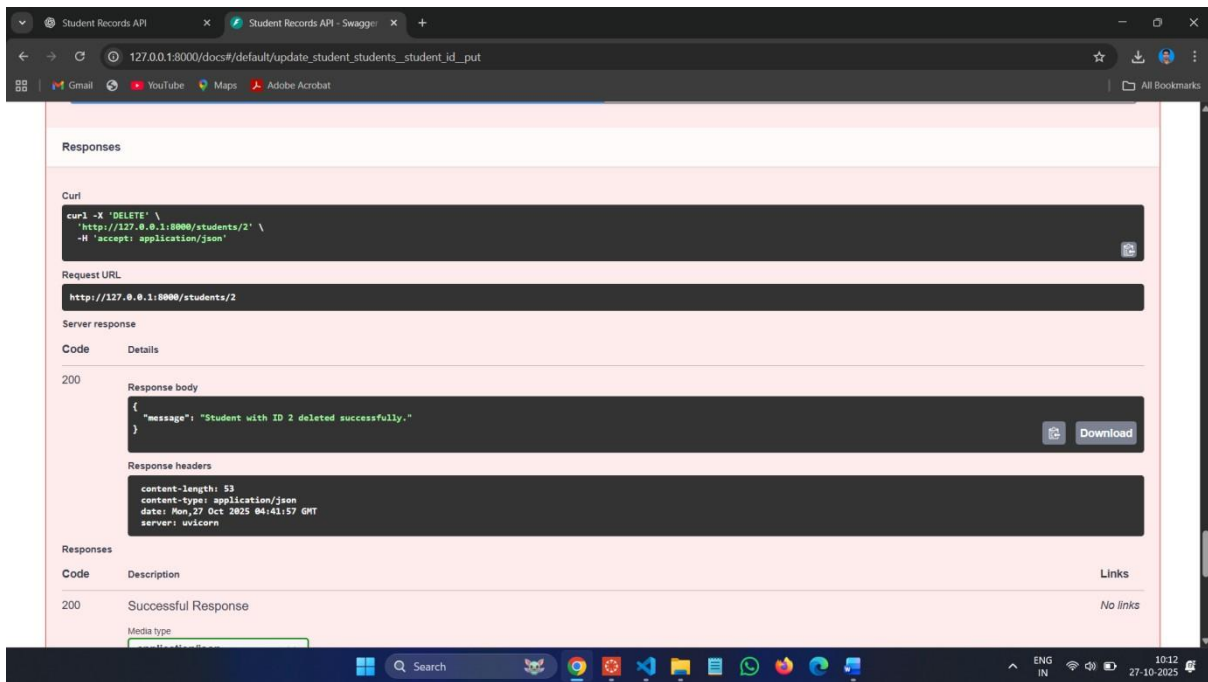

GET :

PUT :

DELETE :

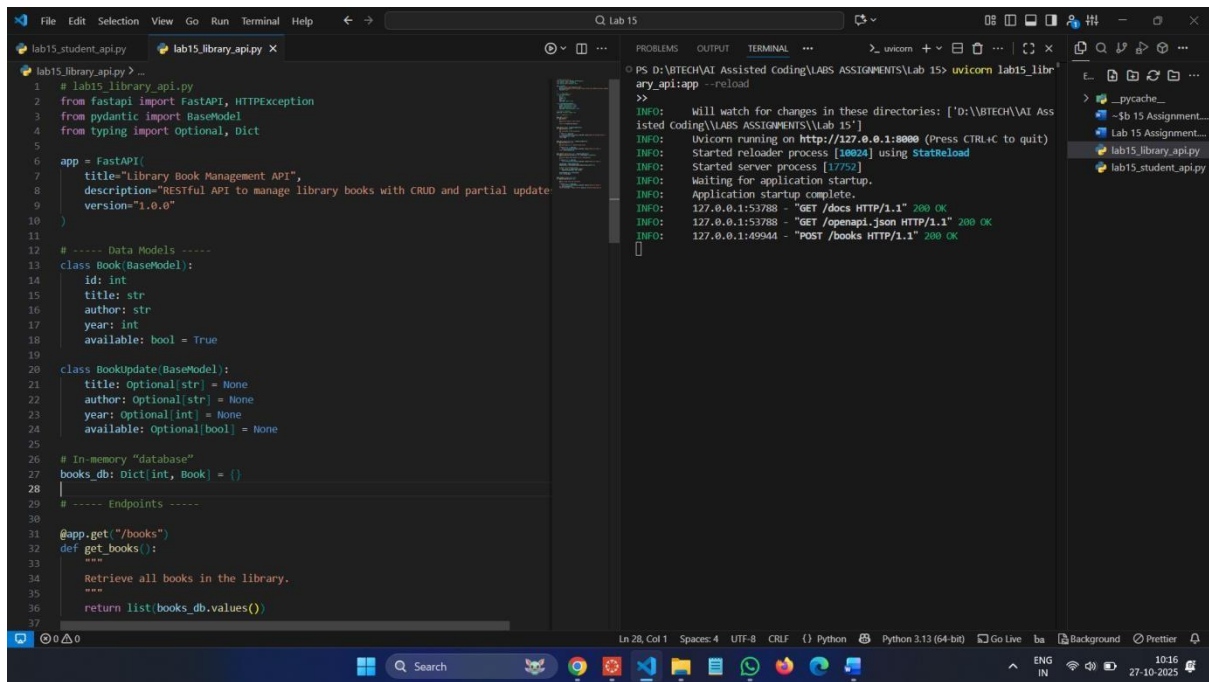

Task 2 – Library Book Management API Task:

Develop a RESTful API to handle library books.

Instructions:

- Endpoints required:
 - o GET /books → Retrieve all books
 - o POST /books → Add a new book
 - o GET /books/{id} → Get details of a specific book
 - o PATCH /books/{id} → Update partial book details (e.g., availability)
 - o DELETE /books/{id} → Remove a book
- Implement error handling for invalid requests.

Code :

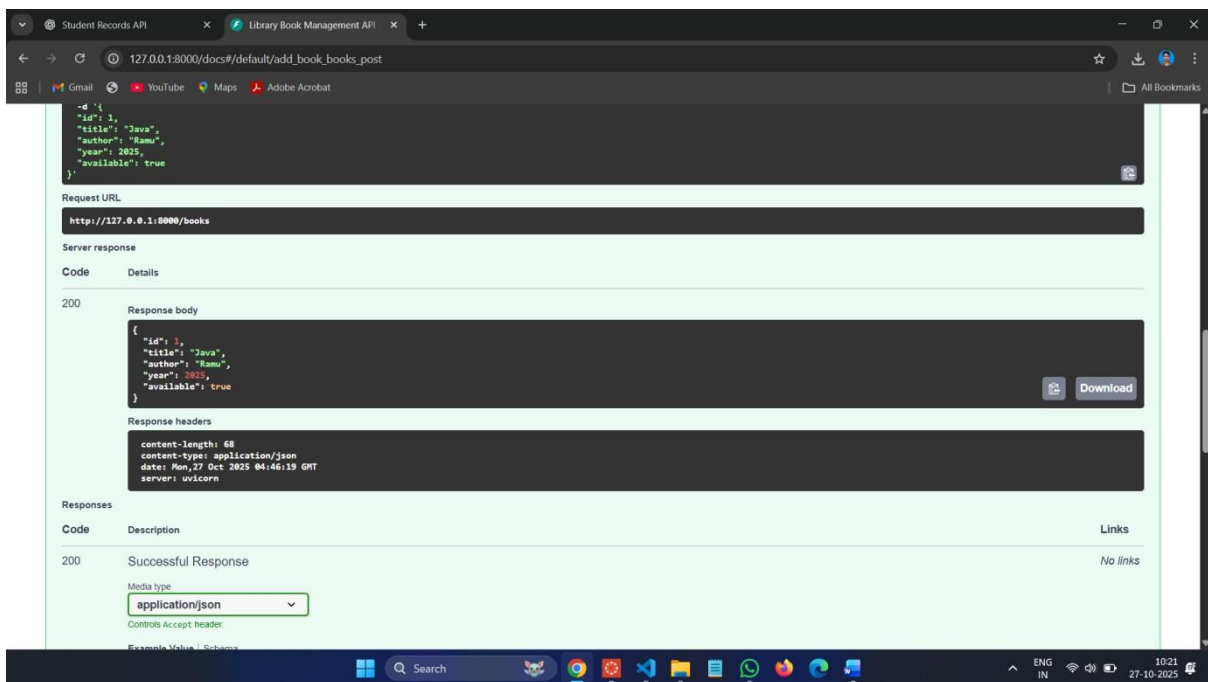

Commands :

uvicorn lab15_library_api:app --reload

Swagger UI:<http://127.0.0.1:8000/docs>

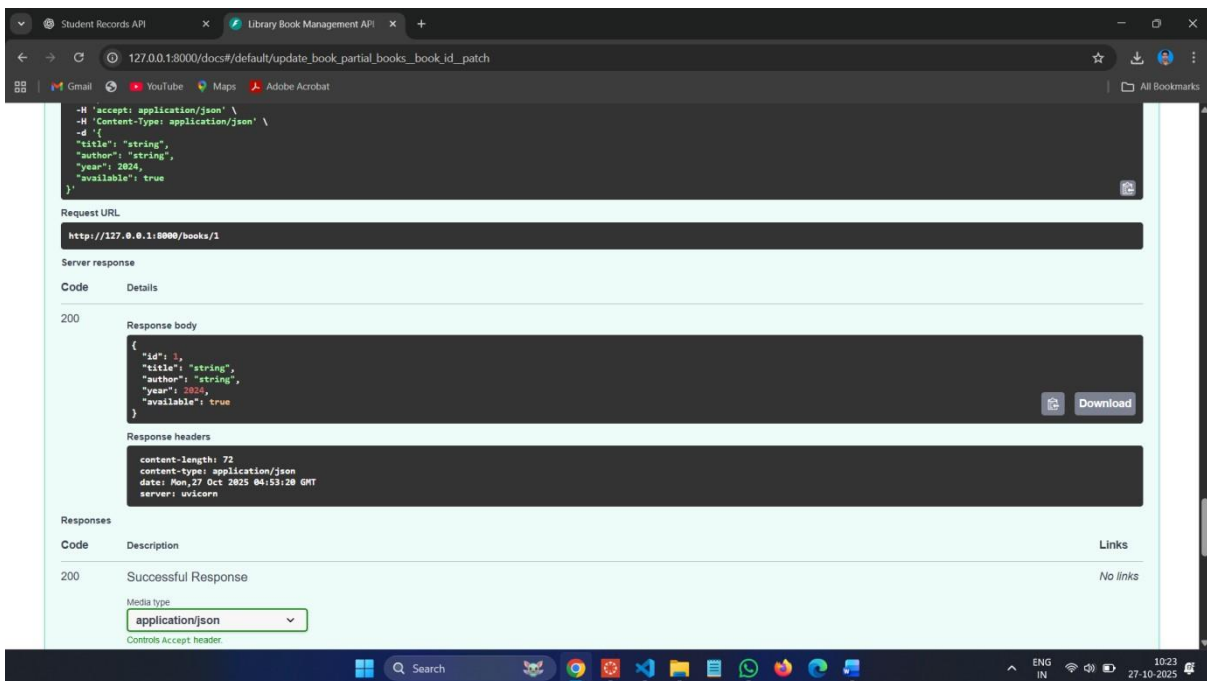

POST :

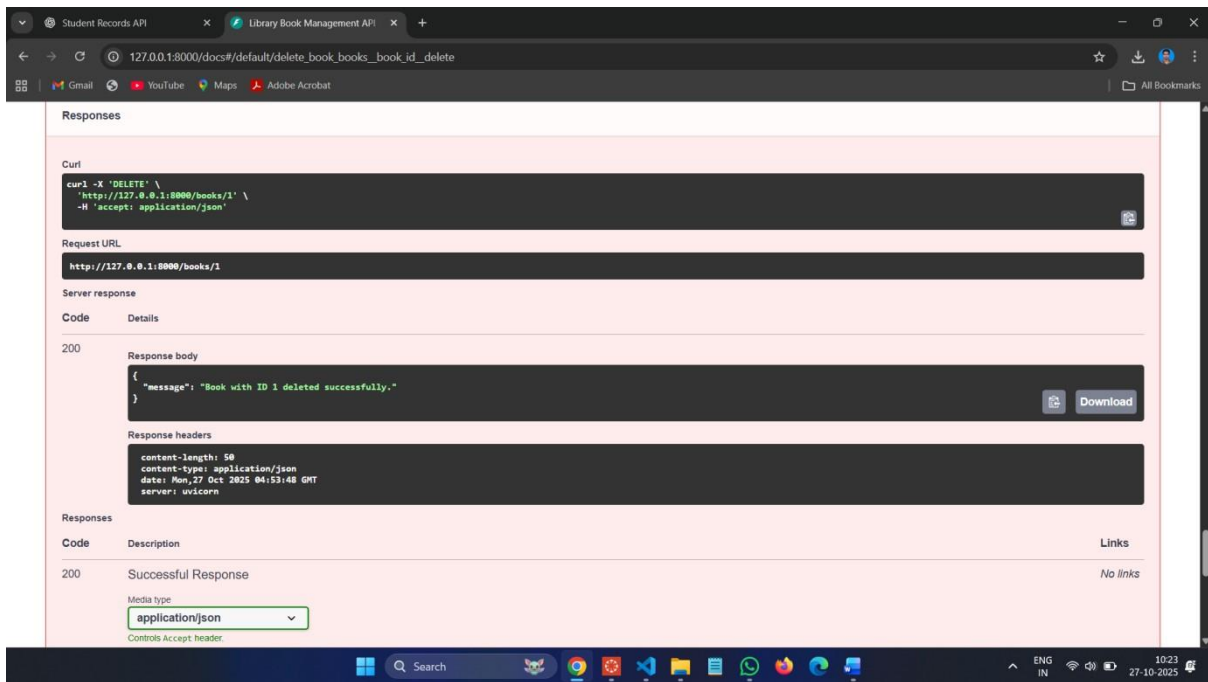

GET :

PUT :

DELETE :

Task 3 – Employee Payroll API Task:

Create an API for managing employees and their salaries.

Instructions:

- Endpoints required:
 - o GET /employees → List all employees
 - o POST /employees → Add a new employee with salary details
 - o PUT /employees/{id}/salary → Update salary of an employee
 - o DELETE /employees/{id} → Remove employee from system
- Use AI to:
 - o Suggest data model structure.
 - o Add comments/docstrings for all endpoints. **Code :**

```
lab15_employee_api.py > delete_employee
# lab15_employee_api.py
1 from fastapi import FastAPI, HTTPException
2 from pydantic import BaseModel, Field
3 from typing import Dict

DELETE :

Task 4 – Real-Time Application: Online Food Ordering API Scenario:

Design a simple API for an online food ordering system.

Requirements:

• Endpoints required:

- o GET /menu → List available dishes
- o POST /order → Place a new order
- o GET /order/{id} → Track order status
- o PUT /order/{id} → Update an existing order (e.g., change items)
- o DELETE /order/{id} → Cancel an order

• AI should generate:

- o REST API code
- o Suggested improvements (like authentication, pagination)

Code :

The image shows a VS Code editor with a Python file named `lab15_food_api.py`. The code defines a FastAPI application for an online food ordering system. It includes data models for `Dish` and `Order`, and an in-memory database. The terminal window shows the command `uvicorn lab15_food_api:app --reload` being executed, and the application is running on `http://127.0.0.1:8000`. The terminal output shows the application startup and several test requests.

```
1 # lab15_food_api.py
2 from fastapi import FastAPI, HTTPException
3 from pydantic import BaseModel, Field
4 from typing import List, Dict, Optional
5
6 app = FastAPI(
7     title="Online Food Ordering API",
8     description="A RESTful API that simulates a basic online food ordering system",
9     version="1.0.0"
10 )
11
12 # ----- Data Models -----
13 class Dish(BaseModel):
14     """Represents a menu item (dish) available for order."""
15     id: int
16     name: str
17     price: float
18
19 class Order(BaseModel):
20     """Represents a customer's food order."""
21     id: int
22     items: List[int] = Field(..., description="List of dish IDs included in the order")
23     status: str = Field(default="Pending", description="Current status of the order")
24     total: float = 0.0
25
26 class OrderUpdate(BaseModel):
27     """Represents updates that can be applied to an existing order."""
28     items: Optional[List[int]] = None
29     status: Optional[str] = None
30
31 # ----- In-memory databases -----
32 menu_db: Dict[int, Dish] = {
33     1: Dish(id=1, name="Margherita Pizza", price=8.99),
34     2: Dish(id=2, name="Cheeseburger", price=7.49),
35     3: Dish(id=3, name="Pasta Alfredo", price=9.25),
36     4: Dish(id=4, name="Caesar Salad", price=5.75),
37 }
```

Terminal output:

```
PS D:\VBTECH\AI Assisted Coding\LABS ASSIGNMENTS\Lab 15> uvicorn lab15_food_api:app --reload
INFO: Will watch for changes in these directories: ['D:\VBTECH\AI Assisted Coding\LABS ASSIGNMENTS\Lab 15']
INFO: Uvicorn running on http://127.0.0.1:8000 (Press CTRL+C to quit)

```

Commands :

`uvicorn lab15_food_api:app --reload`

Swagger UI: <http://127.0.0.1:8000/docs>

POST :

The image shows a web browser window displaying the Swagger UI for the "Online Food Ordering API". The URL is `127.0.0.1:8000/docs#/default/place_order_order_post`. The "Responses" section is expanded, showing the response for a POST request to `/order`. The response body is a JSON object with the following structure:

```
{
  "id": 2,
  "items": [
    1,
    2
  ],
  "status": "Pending",
  "total": 16.48
}
```

The response headers are also displayed:

```
content-length: 55
content-type: application/json
date: Mon, 27 Oct 2025 05:04:35 GMT
server: uvicorn
```

GET :

Student Records API Online Food Ordering API - Sw

127.0.0.1:8000/docs/default/update_order_order_id_put

Responses

Curl

```
curl -X 'GET' \
  'http://127.0.0.1:8000/order/5' \
  -H 'accept: application/json'
```

Request URL

http://127.0.0.1:8000/order/5

Server response

Code	Details
200	<p>Response body</p> <pre>{ "id": 5, "items": [1], "status": "Pending", "total": 8.99 }</pre> <p>Response headers</p> <pre>content-length: 52 content-type: application/json date: Mon, 27 Oct 2025 05:12:31 GMT server: uvicorn</pre>

Responses

DELETE :

Observations:

1. RESTful Design Principles:

Each task followed REST standards — using appropriate HTTP methods (GET, POST, PUT, PATCH, DELETE) and clear URL structures for resources like /students, /books, /employees, and /order.

2. AI-Assisted Code Generation:

AI tools were effectively used to generate data models, endpoint structures, and documentation automatically, saving development time and ensuring consistency.

3. CRUD Operations:

All four APIs successfully implemented CRUD functionality:

o Create: POST requests o Read: GET requests o Update:
PUT/PATCH requests o Delete: DELETE requests

4. Error Handling:

Each API handled invalid requests gracefully using
HTTPException with proper status codes and messages.

5. Auto Documentation:

FastAPI automatically provided API documentation through
/docs (Swagger UI) and /redoc (ReDoc), fulfilling the lab's
documentation objective.

6. Partial Updates & Real-Time Design:

- o Task 2 introduced partial updates (PATCH) for library books.
- o Task 4 simulated a real-world food ordering system with realistic order tracking and AI improvement suggestions.

7. AI-Driven Improvements:

Suggested features such as authentication, pagination, realtime updates (via WebSockets), and database integration demonstrate how AI can enhance backend architecture planning.
